

**A METHOD FOR REVERSING ALZHEIMER DEMENTIA****ABSTRACT OF THE DISCLOSURE**

5

A method of reducing the effects of Alzheimer's Dementia can include a step of administering amoxicillin and Vitamin B<sub>12</sub> to a patient experiencing Alzheimer Dementia. Another step of the method can include administering indomethacin to the patient. The patient can also receive an administration of S-adenosyl-L-methionine and selenium. It has also been found to be beneficial to include a step of administering ibuprofen and/or aspirin to the patient.
